

What Are You Proving? (Week 1 Deliverable)

Track: General AI Fluency | Phase: Setup | Author: Harshit Kudhial (@harshit077) | Date: September 2026

1. The One-Paragraph Proof Statement

"For a VP of Engineering or Technical Founder at an infrastructure or systems-driven software company, I prove that I can engineer deterministic, concurrent software systems under strict performance and reliability constraints—demonstrated through verifiable RTOS driver implementations with zero race conditions, client-holdout tabular ranking pipelines, and type-safe async architectures—compelling them to schedule a 15-minute technical deep-dive call on my calendar."

2. The One-Line Why

"A static CV bullet point can claim 'C++, Python, Concurrency,' but it cannot demonstrate whether I write race-free interrupt handlers or guard against subtle data leakage; owning this proof portfolio provides inspectable, reproducible code artifacts and benchmarked architecture post-mortems that establish technical credibility before the first screening call."

3. Core Triad Dissection & Strategic Focus

Component	Explicit Definition	Pass / Revise Adherence Rationale
The One Claim	I can engineer deterministic, concurrent software systems under strict performance constraints.	Strictly single-skill focus. Avoids the 'and' trap (zero compound claims like 'web and ML and design').
The One Person	VP of Engineering or Technical Founder at an infrastructure or systems software company.	Specific decision-maker who actively suffers from concurrency bugs and has direct senior hiring authority.
The One Action	Schedule a 15-minute technical deep-dive call via calendar booking.	High-intent, friction-free conversion. Replaces passive browsing or multi-field forms with direct scheduling.

4. Socratic AI Interview Transcript (Thinking Partner, Not Author)

Round 1: The Generalist Trap	AI: 'Look at your draft: "I build web apps, ML, and embedded firmware." That's three jobs hiding behind "and". What is the single hardest technical superpower to fake?' Harshit: 'Writing deterministic concurrent code—guaranteeing threads, interrupts, and async streams never produce race conditions or silent corruption under load.'
Round 2: Observable Standard	AI: 'How does a hiring manager verify that without reading 10,000 lines of code?' Harshit: 'In Zephyr RTOS, deterministic state machines with zero ISR deadlocks. In FlyRank ML, honest client-holdout splits without leakage. In full-stack, strict TypeScript contracts and 60fps async state.'
Round 3: The Specific Buyer	AI: 'Who actually pays for this? If you say "tech recruiters", you fail. Name the human.' Harshit: 'A VP of Engineering or Technical Founder building backend infrastructure, robotics, or data platforms who is tired of junior code failing silently under high concurrency.'
Round 4: The Decisive Action	AI: 'What is the logical next step for an engineer of this caliber?' Harshit: 'A 15-minute technical deep-dive call. They bring a hard architectural problem, and we inspect real code artifacts and discuss implementation trade-offs live.'
